Hello all,

I've just upgraded 3d and want to use my 3d 2882 with Cubase.

The generic asio driver doesn't see my device but the WASAPI drivers do work in Maschine 2 so I know the interface is all good.

I've been told that ASIO4ALL is the solution I'm looking for to get ASIO to work with the interface but I've come across a couple of possible alternatives(ASIO2WASAPI and FLEX ASIO).

Does anyone have any experience or recommendations as to what is the best/lowest latency way to get the 2882 3d working with Cubase 10 Pro under Windows 10 as a satellite system?

Thanks,

We have used ASIO4All. Anything that will provide an ASIO driver for a WSAPI device should do the the trick...
