Hi. I'm new here. Been using MH for about 10 years tho and i love the software but switching monitors often causes a pop. I guess it's a zero crossing thing. Sometimes i worry about damaging my speakers when its a really loud one. I guess I could pause the audio every time i switch but it seems like it would be easy to implement a very short fade as each monitor destination (or source) is selected. Or perhaps there's a way to do it that I've missed. I'd be surprised if this has never arisen before, but I couldn't find any mention in the forums. What do you say?

Same thing. New here and switching monitors causes a nasty pop. One set of monitors is connected to the SPDIF of my 2882, the other to the analog outs. When switching from SPDIF to analog it's fine, but the other way there's always a nasty pop.
