I wanna use my ULN-8 interface as monitor controller as shown in this video

https://www.youtube.com/watch?v=MaZwor-L_M4

This guy mentioned Contour Shuttle and Griffin PowerMate. When I press one of the buttons on such a device, there are no lights on the buttons, telling me, which monitor out (A, B or C) is active, right?

Doesn't have to have any audio I/O. As simple as possible. Just some ABC buttons, that are lighting constantly when pushed. Is there something like that on the market?
