Hi guys, I'm going to rephrase my question because I have had no response. Can someone tell me which version of the mil console I currently need to use for El Capitan. I have an older 2882 and I believe that the mixer doesn't work on the older boxes. Any insight would be fantastic. I think I must be using the wrong mio console because on my Yosemite computer the console looks a certain way yet on the el capita it appears differently. I have no idea why.

Make sure you have the "Enable Legacy Box Support" checkbox checked in MIO Console Preferences. New installs have this disabled by default.
