Hello,

I have the first 4 mic input gains linked together, but when I save the preset in Mio console and then recall it on the ULN-8 front panel, everything recalls except the channels are no longer linked. Is this a limitation or an issue?

Thanks!

Instead of dialing in the linking on the front panel, try setting it up in MIO Console. Open the front panel prefs from the drop down menu you get by clicking on your box serial number (toward the top of the I/O Control pane of the MIO Console window). Set the linking up here, then try saving the boot state again.

I hope this is helpful.
