The channel levels in the MIO Mixer are shown delayed and not accurate. Can this be changed somewhere ? On the ULN-8 itself the levels per channel are displayed correctly and without a delay.

Can you elaborate? The meters are updated 30 times per second are are read directly from the HW.

I have connected my ULN-8 with MH Link to a 2018 6 core i7 Mac mini. I use both Edge AES/EBU on Genelec 8531 and the analog outputs for my PSI monitors (no DSP) The Mio Mixer Meters are not in sync with the audio signal from the speakers. But the LED indicators on the ULN.8 are in sync with the audio signal from the speakers. I wonder what might cause this behavior. I never had this before upgrading to 3D

I think you should open a support ticket so we can get more info.

I am not seeing this here; everything is synced.
