Maybe doing something wrong, but I think its since the latest updates.
Always have to unplug the power of the unit to get it back online in the console (and my daws) after I disconnected the hub where the unit is connected via ethernet.
Right now its running, if I disconnect the USB-C Hub knob to take the Macbook with me, and reconnect it later on, I always have to switch power on/off on the unit like I said above.
Never had any issues with exactly this setup until now. So it might have come with the Console and firmware updates?

Config is:
MacBook Air M1
ULN-2 on Satechi Hub via MH Link/Ethernet to USB-C on the Book.
MIO Console 6.1.02
Link Driver 3.0.18
Firmware 6.0.176
OS 12.6.1
Installed the new Driver and the No-Kernel Driver.

Please open a ticket <https://mhsecure.com/support> so that we can gather more information. You can also file a bug from the Help menu after connecting the ULN-2 and seeing it not connect; that will provide some (but perhaps not all) of the logs that we will need to look at.

Thanks for the quick reply.

Bug report via console shows: "internal error: json parse error" when I try to send it.

Even if it seems, like the ticket from the Bug Report out off the Console never reached you...

...workaround seems to be like starting MioConsole before plugin in the Hub which has the

ethernet connection to the interface.

Never needed to do this before, but its not that complicated. :) So, if anyone out there with the same issues. Try it this way from now on.
